

First App in Kotlin: Come get yours now

Today we made the first Android app in Kotlin. We used Android Studio. The app has only one screen. It prints a message for Bart, it says “Hi Bart! I am written in Kotlin.” This is a meme. The app is named Countdown. It’s very basic at the moment. We learned how to use Android Studio. Google has some really good guides about it. You can check them out here:

<https://codelabs.developers.google.com/codelabs/build-your-first-android-app-kotlin/#3>

We are using Google Docs to write our blogs. I just saw how weird Google Docs treats links. It’s as if they are unbreakable. I inserted an image in our blog post, because this blogpost is a meme and the link to the Google guide on Android Studio (i.e. the above link) cannot be wrapped around the image. This is very strange. No wonder everyone uses Microsoft Word. You can make memes much easier in Word.

We need to figure out what framework are we going to use for testing. We also need to create pipelines on Gitlab for testing. We are going to develop our project in a Test Driven manner. I feel this is going to be much easier and lead to better code. This is very exciting.

We have to begin writing our functional specification for the project.
